Establishment of Child Poverty Research

Head Investigator Tokyo Metropolitan University, Graduate School of Humanities, Professor Research Center for Child & Adolescent Poverty, Director

ABE Aya Researcher Number:60415817

研究領域 情報 Number of Research Area: 22A101 Project Period (FY): 2022-2026 Keywords: poverty, poverty database, EBPM, deprivation scale

Purpose and Background of the Research

Outline of the Research

This research field constructs a large-scale database on child poverty and creates evidence-based policy recommendations to local and national governments, NGOs and communities. By doing so, the field combines researchers from multiple academic fields and nurture young researchers with interdisciplinary minds, leading to the establishment of poverty research in Japan.

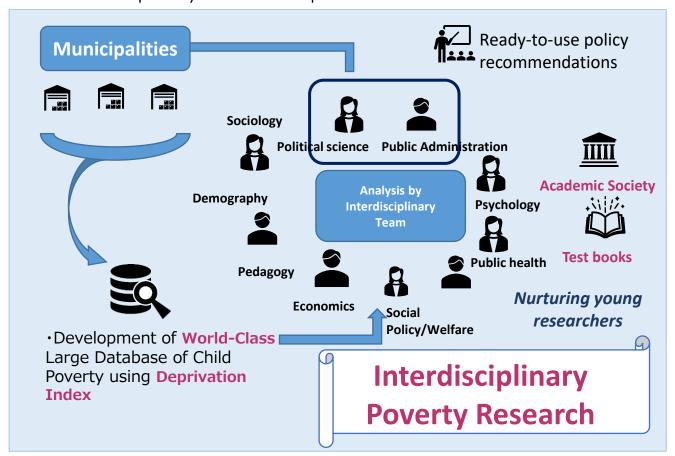

Figure 1. Outline of the Project

• From an variable to an academic field

Background of the Field : In Japan, poverty was a long-forgotten social issue and there was a 40 year period where research on poverty was rarely conducted. However, since the Lehman Shock in 2008, the research using poverty as one of the explanatory variables expanded drastically in various academic fields. Yet, poverty remains as one of the "hot" topics of the moment, and already the interest in poverty is waning. The reason for that is young researchers in each academic field interested in poverty are isolated in their own field and that there is no common platform and definition where researchers from different backgrounds can discuss poverty.

● The 60% of the fund is used for Young Researchers

- 30 Publically called Mini projects
 The research fund with mentoring from senior researchers
- Hands-on Experience for Researchers in training Hiring graduate students and Post-Doc fellows
- Intensive collaboration with overseas researchers
 Participating international conferences

Survey data from Municipalities

> Equivalized Large-scale child poverty database

Development of World-Class Large Database of Child Poverty using Deprivation Index

- Incorporating survey data conducted by multiple local governments to create large-scale database on child poverty
- Conducting additional large-scale survey on child poverty to supplement local government data.
- Development of Japanese child poverty index using deprivation

Expected Research Achievements

• Empirical Research to provide Ready-to-use Policy Recommendations

The database will enable research on mechanism connecting poverty and various child

outcomes, and how geographical attributions, gender, immigrant status, health status of children and their family interact with the mechanism.
