交付決定額(研究期間全体):(直接経費) 3,200,000円

研究成果の概要(和文):This research developed a systematic design framework for robust and adaptive distributed control of multi-agent discrete-event systems. Moreover, this research built a multi-agent experiment platform that tested the validity of the theoretical results.

研究成果の学術的意義や社会的意義

This research has significantly advanced the knowledge in discrete-event systems, by developing new distributed control methods for achieving robust and adaptive behaviors. Further the application of this research would contribute significantly to relieving labor shortage in logistic industries.

研究成果の概要(英文): This research developed a systematic design framework for robust and adaptive distributed control of multi-agent discrete-event systems. Specifically, (i) distributed controllers were designed for individual agents that are robust against partial event observation and inter-agent communication delay; (ii) scalable controllers were synthesized whose state numbers and computational process are independent of the number of agents; (iii) online controllers were designed to provide adaptive behaviors for the agents. Finally, this research built a multi-agent experiment platform that tested the validity of the theoretical results.

研究分野: 制御・システム工学

キーワード:離散事象システム 分散制御 オートマトン

1. 研究開始当初の背景

Recently, with rapid technological advances in wireless communication and embedded computing, distributed control of networked multi-agent discrete-event systems has become a cutting-edge research topic, both domestic and international. For this topic, we have pioneered a systematic approach, called supervisor localization, to distributed control synthesis in the framework of supervisory control theory. The essence of localization is the allocation of global control actions in the form of local control strategies among individual component agents, thereby creating a distributed control architecture over networks. Supervisor localization is a general methodology that addresses heterogeneous agent dynamics and arbitrary control specifications; moreover, it guarantees the collective local control performance is equivalent with the global one.

2. 研究の目的

This research aims to develop a systematic design framework for robust and adaptive distributed control of multi-agent discrete-event systems, by extending our previous work on supervisor localization. In particular, the research focuses on synthesizing distributed controllers that are robust against partial event observation and inter-agent communication delay/loss, as well as adaptive to changes in the number of agents and control specifications. To test the validity of the theoretical results, this research furthermore aims to build a multi-agent experiment platform.

3. 研究の方法

The methods used in this research include supervisory control theory, distributed control theory, discrete-event systems theory, automata theory, and computational complexity theory.

4. 研究成果

There are five main accomplishments achieved in this research.

(1) Distributed control with partial observation

Collaborating with Dr. R. Zhang (Northwestern Polytechnical University) and Dr. W.M. Wonham (University of Toronto), we extended supervisor localization to address the issue of partial observation in distributed control of multi-agent discrete-event systems. First, we proposed the combination of supervisor localization with relative observability, which leads to a systematic, computationally effective approach to distributed control of DES under partial observation. In particular, local controllers with only observable state transitions are automatically synthesized, and the collective local controlled behavior is guaranteed to be the same as the global nonblocking behavior. Second, we identified the linguistic essence of partial-observation localization by developing the following key mappings and concepts (as extensions to their full-observation counterparts). Based on these mappings, the new concepts are introduced, including partial-observation control covers and local controllers. In particular, a partial-observation control cover is defined on the state set of the partialobservation supervisor; roughly speaking, the latter corresponds to the powerset of the fullobservation supervisor's state set. Moreover, a partial-observation local controller contains only observable state transitions, and uses control functions to determine the existence of selfloops of unobservable controllable events.

We further generalized partial observation supervisor localization to study distributed control of timed discrete-event systems. First, not only was the monolithic supervisor's disabling action localized (as in the untimed case), but also its preemptive action is localized with respect to individual forcible events. Second, the new concepts of partial-observation control cover and partial-observation preemption cover were defined on the powerset of the monolithic supervisor's state set. In this way, in the transition structure of the resulting local controllers/preemptors, only observable events can lead to state changes.

Zhang and K. Cai, "Supervisor localization for large-scale discrete-event systems under partial observation", International Journal of Control, vol. 93, no. 3, pp. 387-399, Mar. 2020.

(2) Distributed control with communication delay

Collaborating with Dr. R. Zhang (Northwestern Polytechnical University), we extended supervisor localization to address the issue of communication delay in distributed control of multi-agent timed discrete-event systems. A timed channel model which can represent bounded and unbounded communication delays was proposed. This channel model was treated as plant component, and thus the communication delays are integrated into the plant behavior. Timed relative coobservability was adopted to effectively compute decentralized supervisors tolerant of communication delays. The combination of timed relative coobservability and partial-observation supervisor localization was new, and led to a computationally effective solution to delay-tolerant distributed control. Overall, the proposed supervisor localization provided a top-down, computationally effective approach to the distributed control of timed discrete-event systems with inter-agent communication delay.

R. Zhang and K. Cai, "Localization-based distributed control of timed discrete-event systems with communication delay", International Journal of Control, accepted, Apr. 4, 2020.

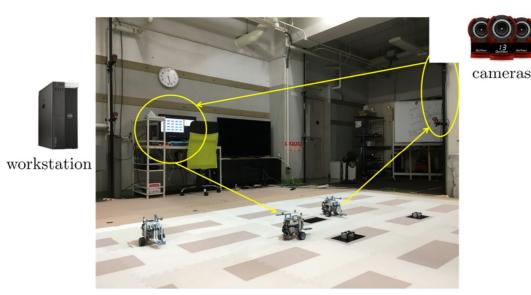

(3) Scalable distributed control

Collaborating with Dr. Y. Liu and Dr. Z. Li (Xidian University), we exploited the modular characteristic of multi-agent discrete-event systems, and thereby designed a scalable supervisor whose state number and computational process are independent of the number of agents. The contributions of our work are threefold. First, our designed centralized supervisor was scalable with respect to the number of agents in the system. This scalability was a desired feature of a supervisor for multi-agent systems, inasmuch as it allows the supervisor to remain invariant regardless of how many agents are added to or removed from the system (which may occur frequently due to productivity/reliability concerns or malfunction/repair). Second, the local controllers we designed for individual agents enjoyed the same scalability feature, and are guaranteed to collectively achieve identical controlled behavior as the centralized supervisor does. With the local controllers 'built-in', the agents became autonomous and made their own local decisions; this was particularly useful in applications like multi-robot systems. Finally, the computation of the scalable supervisor and local controllers was based solely on template structures and was thus independent of agent numbers as well. As a result, the computation load remained the same even if the number of agents increased; this was advantageous as compared to the existing supervisory synthesis methods.

Y. Liu, K. Cai, and Z. Li, "Scalable supervisory control of multi-agent discrete-event systems", Automatica, accepted, Jul. 2019.

(4) Application to multi-robot based warehouse logistic automation

Collaborating with my students and Dr. Z. Lin (Hangdian University), we adapted the online supervisory control approach to the case of multi-agent discrete-event systems to not only cope with computational efforts but also address time-varying specifications, and applied the approach to warehouse automation systems served by multiple mobile robots. First, we presented a key modification to the existing online supervisory control approach such that the approach is amenable to multi-agent discrete-event systems. In particular, we proposed to first generate limited-step-ahead projections of each agent model, and then compute the synchronous product of the projected agent models. This is computationally more efficient than the existing approaches in the literature. Second, we showed how a warehouse automation system served by multiple robots could be modeled as a multi-agent discrete-event systems, and demonstrated through a case study the effectiveness of applying the adapted online supervisory control approach to control the automation system. Finally, we built a testbed, consisting of multiple LEGO MINDSTORMS EV3 robots, that served to experimentally test the validity of our proposed online supervisory control approach for multi-agent discrete-event systems. The experiment testbed is shown below.

(5) Contributions to education

Collaborating with Dr. W.M. Wonham (University of Toronto) and Dr. Rudie (Queen's University), we summarized a brief history of the 'supervisory control of discrete-event systems' as it had evolved in the period 1980–2017. Overall, the trend had been from centralized or 'monolithic' control to more structured architectures, and from 'naive' to symbolic computation. We also provided tutorial material on the supervisory control theory and the supervisory localization theory. These papers provided entry-level education of graduate students and young researchers for doing research in this field.

Saparrioti, Santia, ar marri agent around ovent systems with marehouse automatron case study
3.学会等名
SICE Annual Conference(招待講演)(国際学会)
4.発表年
2018年
1.発表者名
S. Matsui, Kai Cai
o. matour, rar our
2.発表標題
Secret securing with minimum cost
3.学会等名
Japan Joint Automatic Control Conference
4.発表年
2018年
1 X=20
1.発表者名
W.M. Wonham, Kai Cai, K. Rudie
N. 4. 17 17
2.発表標題
Supervisory control of discrete-event systems: a brief history 1980-2015
3.学会等名
20th IFAC World Congress (招待講演) (国際学会)
20th Hill with a bong roos (in higher) (in higher)
4 . 発表年
2017年

1.発表者名
R. Zhang, Kai Cai
an grant and the second
2.発表標題
Supervisor localization of timed discrete-event systems under partial observation
3.学会等名
IEEE Conference on Decision and Control(国際学会)
4.発表年
2016年
 1
1.発表者名
R. Zhang, Kai Cai
er gan er en e
2 . 発表標題
On supervisor localization based distributed control of discrete-event systems under partial observation
2.
3.学会等名
American Control Conference(国際学会)
4.発表年
2016年
2010年
1.発表者名
Kai Cai, A. Giua, C. Seatzu
nai vai, n. viua, v. voatzu
2.発表標題
On consistent reduction in discrete-event systems
3 . 学会等名
15th IEEE International Conference on Automation Science and Engineering(招待講演)(国際学会)
4 . 発表年
2019年
1 ※主之ク
1.発表者名 S. Mataui, Kai Cai
S. Matsui, Kai Cai
2.発表標題
Secret securing with multiple protections and minimum costs
3.学会等名
58th IEEE Conference on Decision and Control(招待講演)(国際学会)
4 . 発表年
2019年

ſ	図書]	 1	件

1.著者名 W.M. Wonham, Kai Cai	4.発行年 2019年
2 111571	Γ 465 A° 25 WH
2. 出版社 Springer	5.総ページ数 600
3 . 書名	
Supervisory Control of Discrete-Event Systems	

〔産業財産権〕
