研究成果の概要（和文）：1) 圧力条件 1-30GPa、温度条件 27-1400 度において単純な炭酸塩系 (Na_2CO_3 , K_2CO_3 , CaCO_3 , FeCO_3) の X 線回折パターンの取得し、相関係と状態方程式を制約することに成功した。

2) 下部マントルから炭酸塩メルトと含水メルトの上昇メカニズムと速度を推定した。

得られたメカニズムは “dissolution-precipitation” といい、メルトからの珪酸塩成分の拡散輸送によって支配されている。

3) マントルに相当する条件下において単純な炭酸塩系 ($\text{K}-\text{Mg}$, $\text{K}-\text{Ca}$, $\text{Na}-\text{Mg}$, $\text{Na}-\text{Ca}$, $\text{K}-\text{Ca}-\text{Mg}$, $\text{Na}-\text{Ca}-\text{Mg}$, $\text{K}-\text{Na}-\text{Ca}-\text{Mg}$) の相平衡と融解関係の決定をするためのデータを取得した。

研究成果の概要（英文）：1) Recently I completed to collect X-ray diffraction patterns for simple carbonate systems Na_2CO_3 , K_2CO_3 , CaCO_3 , and FeCO_3 in the range 1-30 GPa and 27-1400° C to constrain phase relations and EOS. 2) I supposed mechanism and estimated possible rates of carbonatite± H_2O and hydrous melt ascent from the transition zone and might be lower mantle. This mechanism so called “dissolution-precipitation” controlled by diffusion transport of silicate components via hydrous or carbonatite melt. 3) I collected experimental data point to constrain phase diagrams and melting phase relations in simple carbonate systems ($\text{K}-\text{Mg}$, $\text{K}-\text{Ca}$, $\text{Na}-\text{Mg}$, $\text{Na}-\text{Ca}$, $\text{K}-\text{Ca}-\text{Mg}$, $\text{Na}-\text{Ca}-\text{Mg}$, $\text{K}-\text{Na}-\text{Ca}-\text{Mg}$) at the conditions corresponding to the basement of lithospheric mantle.

1. 研究開始当初の背景

深部マントルにおけるマグマ生成と相関係においてアルカリ金属を含む炭酸塩の系は重要な役割を果たしている。

また、高い駆動力のため、炭酸塩メルトはマントル中への炭素の運び手となり
